

## 8.7.3 Quota Facts

This lesson covers the following topics:

- About disk quotas
- Implementing disk quotas
- Disk quotas commands

### About Disk Quotas

Disk quotas prevent a user or group from using a disproportionate amount of disk space on a volume. Quotas can be configured to:

- Limit the number of files and directories a user or group can create.
- Limit the amount of disk space a user or group can use.

Quota types include the following:

- A soft limit allows the user to temporarily exceed a quota limit.
- A hard limit is a fixed limit that the user cannot exceed.

### Implementing Disk Quotas

The following table lists the general steps to implement quotas:

| Step                                    | Procedure  |
|---|--|
| Install quota package                   | Use yum, zypper, or apt-get to install the <b>quota</b> package on the system where quota limits will be set.  |
| Edit mount options in <b>/etc/fstab</b> | Edit the <b>/etc/fstab</b> file to add the mount options for the file system to enable quotas: <ul style="list-style-type: none"> <li>▪ <b>usrquota</b> enables quotas for users.</li> <li>▪ <b>grpquota</b> enables quotas for groups.</li> </ul>   |
| Create quota files                      | Create the <b>aquota.user</b> and <b>aquota.group</b> files in the directory where the partition is mounted.   |
| Enable quotas and view a quota report   | Enable disk quotas and then generate a disk usage and quota report. The report shows: <ul style="list-style-type: none"> <li>▪ How much space to allocate to each user.</li> <li>▪ How much space is currently consumed by each user.</li> <li>▪ Whether some users are using a significant amount of disk space.</li> </ul>   |
| Edit quotas                             | Edit a quota for the specified user or group. Be aware of the following when editing quotas: <ul style="list-style-type: none"> <li>▪ Set the soft and hard quotas for blocks. This limits the total amount of disk space per user or group.</li> <li>▪ Set the hard and soft quotas for inodes. This limits the total number of files and directories per user or group.</li> <li>▪ Users may exceed soft quotas for a number of days specified in the grace period (seven by default). When the grace period expires, users cannot create additional files.</li> <li>▪ Users cannot exceed hard quotas.</li> <li>▪ When setting block quotas, 1000 blocks is about 1 MB, and 1,000,000 blocks is about 1 GB.</li> <li>▪ Setting the quota limits to 0 removes all quotas.</li> </ul> |

### Disk Quotas Commands

The table below describes common commands for working with quotas:

| Command                  | Function  | Examples   |
|--------------------------|---|--|
| <b>quotacheck -mavug</b> | To create the <b>aquota.user</b> and <b>aquota.group</b> files in the file system (after placing the quota entries in <b>/etc/fstab</b> ). Common options include: <ul style="list-style-type: none"> <li>▪ <b>-m</b> updates the quota database even if other processes are running on the file system.</li> <li>▪ <b>-a</b> updates the quota database.</li> <li>▪ <b>-v</b> runs the command in verbose mode.</li> <li>▪ <b>-u</b> and <b>-g</b> run the database updates for users and groups, respectively.</li> </ul> | <b>quotacheck -mavug /home</b> creates the <b>aquota.user</b> and <b>aquota.group</b> files in the root (/) directory. |

|                 |   |  |
|-----------------|---|--|
| <b>quotaon</b>  | <p>Enables quotas for the mounted file system as follows:</p> <ul style="list-style-type: none"> <li>▪ <b>-a</b> enables all mounted file systems listed in <b>/etc/mtab</b>.</li> <li>▪ <b>-v</b> runs the command in verbose mode.</li> </ul>   | <b>quotaon -av</b> / enables quotas for the root (/) directory.  |
| <b>quotaoff</b> | Disables quotas for the mounted file system.  | <b>quotaoff /home</b> disables quotas for the <b>/home</b> directory.  |
| <b>repquota</b> | <p>Displays a summary of the disc usage and quotas for the specified file systems, including the specific number of files and used space by user. Common options include:</p> <ul style="list-style-type: none"> <li>▪ <b>-v</b> reports all quotas, even if there is no usage.</li> <li>▪ <b>-n</b> does not resolve user and group names to speed printing time.</li> <li>▪ <b>-u</b> and <b>-g</b> report for users and groups, respectively.</li> <li>▪ <b>-a</b> gives information for all file systems listed in <b>/etc/mtab</b>.</li> </ul> | <b>repquota /home -uv</b> creates a user quota report for the <b>/home</b> directory.  |
| <b>edquota</b>  | <p>Opens and edit a user's quota, a group's quota, or change the grace period:</p> <ul style="list-style-type: none"> <li>▪ <b>-u</b> changes the user's quota.</li> <li>▪ <b>-g</b> changes a group's quota.</li> <li>▪ <b>-t</b> changes the grace period.</li> </ul>   | <b>edquota -u mtomm</b> opens the quota file for the mtomm user account.   |
| <b>quota</b>    | <p>Displays the current user's quota:</p> <ul style="list-style-type: none"> <li>▪ <b>-u</b> shows the quota for a user.</li> <li>▪ <b>-g</b> shows the quota for a group.</li> <li>▪ <b>-v</b> shows current the current usage, the hard quota and the soft quota for blocks and inodes.</li> </ul>  | <p><b>quota</b> displays the quota report only for the current user account.</p> <p><b>quota -u dhanson</b> displays the quota report only for the dhanson user account.</p> |
